

Dashboard and reporting

The Dashboard shows the level of fulfilment of the goals established by the company. The safety field helps to express the safety goals by way of indicators, and also to assess the results and take appropriate corrective actions.

It is a tool which will allow you to analyse your company's safety system in terms of business strategy, providing an overview of all current actions and their progress. This overview is essential for the proper operation of the business.

The reports will let you extract the necessary information from the safety system records in a personalised format.

Automatically obtain and calculate all the indicators for different units, divisions and departments in a matter of seconds, allowing you to spend your time analysing the information. You can ask for this information to be published on an intranet portal or for the system to send a report in PDF format on a specific day of the month.

Safety portal

A Safety Portal is the adaptation of the Employee Portal concept applied to matters of safety at work. Employee portals came about through the need to communicate an ever-increasing amount of information to employees. This is one of the best practices used by leading companies in safety.

Since this is the access point for all employees to company information on safety at work, it is important to spend time deciding which information the portal should provide (alerts, news, links) and to update it regularly.

The possibilities of the safety portal can be increased by customising it for each employee to see specific information: outstanding tasks, risk assessment, documentation to be reviewed, key indicators of the unit dashboard, etc.
