

hazard reporting

Implementing a Risk Reporting application is a very straightforward and efficient way of promoting the culture of distributed safety management in the company. The aim is to institutionalise the fact that each employee should be trained in the responsibility of detecting, communicating and neutralising hazardous situations in his or her working environment.

As part of the software application, a designated committee will regularly review the communications made, propose corrective actions and give feedback to the organisation.

The Risk Reporting application includes the best practice on the market and will allow you to:

- Make reporting the risk easier, indicating the person and place involved along with the risk and its causes.
- Record both immediate and proposed corrective actions, along with the people in charge and the deadlines.
- Inform all personnel involved by e-mail and monitor the tasks.

this software application is recommended if...

- You want to take the first step towards behaviour-based and shared safety, encouraging employees to get actively involved.
- You are going to create a committee entrusted with regularly reviewing the safety communications made and the corrective actions resulting from them.
- You wish to implement the best safety management practice currently existing on the market.
