

non-conformities

A Non-Conformity is a breach of a management system requirement. Prevention management systems such as OHSAS18000, along with quality and environment systems (ISO 9000, ISO 14000) require a register of non-conformities to be kept.

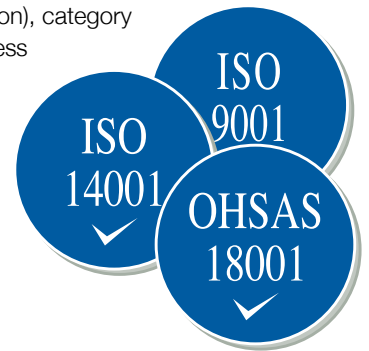

The analysis of the causes of each non-conformity will bring about a corrective action plan, to which a person in charge and a deadline must be assigned, and which must be subsequently monitored.

use

This Non-Conformities application, along with the recommended practice, will allow you to:

- **Register** the non-conformities, indicating the location and scope and the team in charge of completion.
- **Classify** the non-conformity, indicating the type (non-conformity, deviation, observation), category (safety, environment, quality), character (real, potential), severity (light, serious) and process area (to be defined by the client).
- **the causes and the corrective actions** proposed in order to prevent any repeat, with the people in charge and deadlines.
- **Inform** employees by e-mail or through the corporate safety portal of the tasks assigned, ensuring they are not forgotten about or left unfinished.
- **Attach** files with supplementary information.

this software application is recommended if...

- You wish to implement or develop a safety, quality or environmental management system such as OHSAS, ISO, etc.
- An automated system is required in order to keep all deviations from the rules under control, which can then be used as evidence of fulfilment of the requirements of the management system.
- The goal of the organisation is to get employees actively involved both in the creation of non-conformities and in the management of the deriving actions, and to fulfil the requirements for certification.
