

safety audits

It is recommended that companies with their own prevention service should audit their Safety System. Moreover, those companies who wish to achieve certification such as OHSAS 18000 or similar should use different types of audits (internal, external, regulatory, etc.) in order to know and objectively assess their management system.

These audits involve the auditing team and the heads of the audited divisions, whilst the workers themselves are involved in interviews, the assignment of corrective actions, etc.

Other management systems such as ISO 9000 or ISO 14000 also require an audit software application, making it essential to count on a tool which can help to organise and systematise both the audits and their deriving actions, and to manage all the related documentation.

use

This Safety Audits application, along with the recommended practice, will allow you to:

- Plan the audit, indicating the location and scope and the auditing team in charge of completion.
- Document the result of the audit and the points audited, and assign a score.
- Discover the findings (both observations and deviations).
- Define an action plan which contains the proposed corrective actions to be carried out, with the people in charge and deadlines.
- Inform the employees involved by e-mail or through the safety portal, ensuring they are not forgotten about or left unfinished.

this software application is recommended if...

- You have implemented a certifiable management system such as OHSAS 18000, ISO, etc.
- The company wants to publicise both the audits made and the corrective actions.
- You want to drastically reduce bureaucracy and increase efficiency.
